Our order process is a bottleneck

Today: every hardware order is handled by hand

1. **Manual re-typing**
   Order details copied from PDF by hand, so typos and wrong items slip in

2. **Slow, repeated checks**
   Two systems checked one after the other for every order

3. **Problems stall orders**
   Questions go back by email and the order waits for a reply

Also: orders wait whenever staff are away. Timings are estimates to be confirmed with Operations.

Meet OrderBot, our autonomous AI agent

Same steps, done automatically in minutes, 24/7

- **Reads** every order email the moment it arrives
- **Checks** the customer and stock in seconds
- **Decides** routine orders alone; hands tricky ones to a person, with the reason

People stay in control: staff handle every exception, and every action is logged.

Faster orders, fewer errors, low-risk start

< 5 min

order to confirmation (target), down from hours

99.5%

accuracy target, checked before go-live

24/7

no waiting for someone to be at their desk

More time

staff freed for customers and tricky orders

Next step: a read-only Proof of Concept

1. **Watch:** OrderBot reads real orders but changes nothing
2. **Compare:** its decisions against what staff actually did
3. **Decide:** go or no-go on a phased rollout, based on measured accuracy

Our ask: approve a 4-week read-only pilot. No risk to live orders.
